LABORATORY REPORT

1. The purpose of this experiment was to determine the effect of temperature on the rate of photosynthesis. The hypothesis was that as temperature increases, the rate of photosynthesis will also increase up to an optimal point, after which it will decrease.

PVI:

150

2. The independent variable was temperature, and the dependent variable was the rate of photosynthesis, measured by the volume of oxygen gas produced. The control was the rate of photosynthesis at room temperature (25°C). The results showed that the rate of photosynthesis increased with temperature up to 35°C, after which it decreased. This is likely due to the fact that enzymes involved in photosynthesis have an optimal temperature range.

3. The data collected during the experiment is as follows:

Temperature (°C)	Volume of O ₂ (mL)
10	1.0
20	2.0
30	3.0
35	4.0
40	3.0
50	1.0

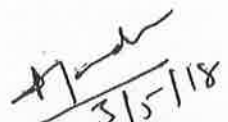

4. The conclusion is that the rate of photosynthesis is highly dependent on temperature. The optimal temperature for photosynthesis in this experiment was 35°C. This is consistent with the known fact that most enzymes have an optimal temperature range between 30°C and 40°C.

Dear Mr. Goldstein:

I have received your letter of October 10, 1950, regarding the
analysis of the sample of polyethylene which you have
kindly placed at my disposal. The results of the analysis
are given in the attached report.

The sample appears to be a high density polyethylene
with a melting point of approximately 130°C. The
infrared spectrum shows characteristic absorption bands
for polyethylene, and the elemental analysis is in
agreement with the theoretical composition of C₂H₄.

I am sure that these results will be of interest to you.
If you have any further questions, please do not
hesitate to contact me.

Sincerely,
